Abstract

The **Wikipedia Search and Text-to-Speech Application** is a user-friendly web-based project designed to provide quick and easy access to information from Wikipedia. The application allows users to search for any topic of interest and instantly retrieve relevant Wikipedia articles and summaries. By integrating the Wikipedia API, the system ensures that users receive accurate, up-to-date, and reliable information in real time.

A key feature of the project is its **Text-to-Speech (TTS)** functionality, which enables users to listen to the retrieved content instead of reading it. This feature enhances accessibility for visually impaired users, individuals with reading difficulties, and users who prefer audio-based learning. The application offers a convenient and interactive way to consume information, making knowledge more accessible to a wider audience.

The project combines information retrieval and speech synthesis technologies to create an efficient, informative, and inclusive platform. By providing both reading and listening options, it improves user experience and supports different learning preferences. Overall, the Wikipedia Search and Text-to-Speech Application serves as a practical solution for accessing and understanding information quickly and conveniently.
